MGT 403 — Final Project: Where Should We Open Our Next Center-Based Preschools?

Team: Ignacio Sanchez Urdaneta · Beck Jamilov · Claudia Palacios Surco · Gary Chen

Purpose of this document. This is the analysis behind our final presentation (slides to follow): the pre-analysis of prices and costs, the county recommendation with its methodology and reliability checks, and an appendix of data-handling decisions. All code, data and the prompt history are in the project repository, https://github.com/ignaciosanur/mgt403-childcare-project-green-cohort-7b (`final_analysis.py`).

Data. Metro counties only (counties in an OEWS metropolitan area, `oews_area` begins with `00`), 2015–2022. *Price:* NDCP median weekly full-time price of **center-based preschool care (36–54 months)**. *Costs:* BLS OEWS mean annual wage of childcare workers (SOC 39-9011), which is published per metro area, and ACS median gross rent per county. *Demand:* ACS 5-year county covariates. All dollar values are in constant 2022 dollars (CPI-U). The county is the unit of analysis throughout.

Summary: our top 10

We define an attractive market as a county where preschool prices are **high relative to what labor and rent costs predict**. We estimate a cost model of prices on childcare wages and rent, measure each county's **premium** (actual price minus cost-predicted price), keep counties with a large enough market and a premium that has been positive since 2019, and rank them by their 2022 premium.

#	County	Metro area	Price ($/wk)	Cost-predicted ($/wk)	Premium ($/wk)
1	Arlington County, VA	Washington-Arlington-Alexandria	496	296	**+201** (+68%)
2	Stearns County, MN	St. Cloud	337	167	**+170** (+102%)
3	Alexandria city, VA	Washington-Arlington-Alexandria	424	281	**+143** (+51%)
4	San Francisco County, CA	San Francisco-Oakland-Hayward	477	334	**+143** (+43%)
5	Winnebago County, WI	Oshkosh-Neenah	259	133	**+126** (+95%)
6	Olmsted County, MN	Rochester	309	189	**+120** (+63%)
7	La Crosse County, WI	La Crosse-Onalaska	259	140	**+119** (+85%)
8	Norfolk County, MA	Boston-Cambridge-Nashua	420	304	**+116** (+38%)
9	McLean County, IL	Bloomington	279	168	**+111** (+66%)
10	Brown County, WI	Green Bay	259	159	**+100** (+63%)

The top 10 charge on average $352 a week against a cost prediction of $217, a premium of about **$135 a week per preschooler**. **Reliability caveat:** four of the ten (the three Wisconsin counties and Olmsted, MN) report a *regional* price shared with 7–8 other counties in their state, so their premium is less certain. Section (b) gives a robustness list using only county-specific prices, which replaces them with Howard County MD, Burlington County NJ, DuPage County IL and Gloucester County NJ.

Part A. Pre-analysis: prices and costs

A1. Analysis dataset

We merged the NDCP prices onto the year × county cost and demand file from Problem Set 5 (on county FIPS × year). The analysis dataset contains the **metro county-years with a non-missing preschool price and non-missing values for all predictors** (childcare wage, rent, and the eight ACS variables).

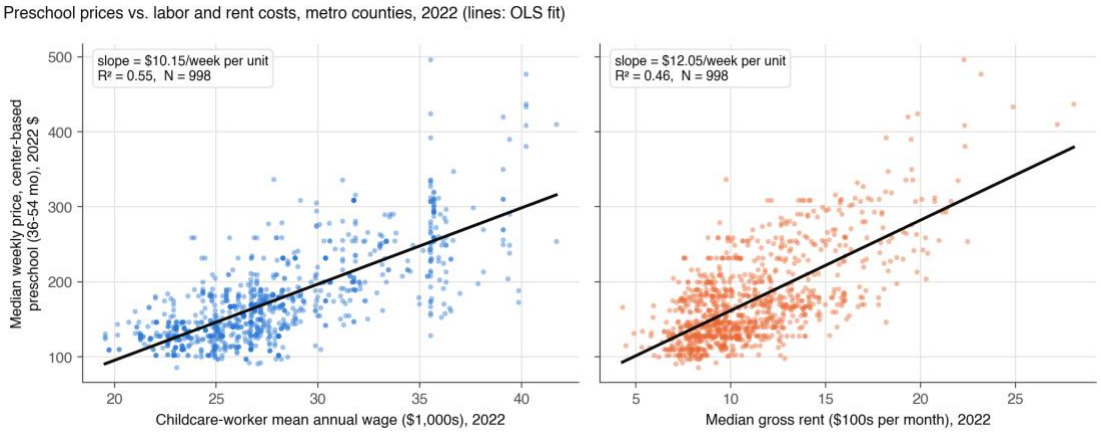

Year	2015	2016	2017	2018	2019	2020	2021	2022
Counties in the analysis dataset	994	1,019	1,057	1,062	1,061	1,050	905	998

In 2022, of 1,235 metro counties, 222 have no NDCP price (mainly whole states without usable price surveys: Pennsylvania, Indiana, Missouri, New Mexico, Arkansas and Puerto Rico) and 15 have a price but a missing predictor (no OEWS wage, or Connecticut's 2022 ACS geography change), leaving **998 counties**.

A2. Analysis sample, 2022

Variable (metro counties, 2022)	N	Mean	SD	Min	Max
Median weekly price, center-based preschool (36–54 months)	998	$174.48	$59.76	$86.19	$496.30
Childcare-worker mean annual wage	998	$27,780	$4,351	$19,540	$41,700
Median gross rent, per month	998	$1,106	$336	$430	$2,805
Per-capita income	998	$37,859	$9,457	$16,368	$89,702
Total population	998	255,803	551,110	50	9,936,690
Own children under 6	998	17,151	37,250	0	616,046
Children under 6 with all parents in the labor force	998	11,538	24,539	0	406,465
Share of women 25+ with a bachelor's degree or higher	998	30.6%	11.1 pp	8.1%	77.6%
Share of women 16–64 working full-time, year-round	998	44.6%	5.6 pp	21.2%	71.4%
Share of the population under 6	998	6.4%	1.1 pp	0.0%	10.9%
Share of the population under 6 with all parents working	998	4.3%	0.9 pp	0.0%	7.0%

A3. Prices against wages and rents

Both costs line up strongly with prices: counties where childcare workers earn more and where rents are higher charge more for preschool. Wages alone explain 55% of the variation in prices across counties, rent alone 46%. The spread around each line is wide, though: at a wage of about $35,000, prices range from about $130 to almost $500 a week. That spread is what our recommendation exploits. The vertical stripes in the wage panel appear because all counties in a metro area share one OEWS wage.

A4. Regressions of the 2022 preschool price on wages and rent

Units: price in $ per week; wage in $1,000 per year; rent in $100 per month. Standard errors in parentheses.

	(a) Wage only	(b) Rent only	(c) Wage and rent
Childcare wage ($1,000/yr)	**10.15** (0.29)		**7.09** (0.37)
Median gross rent ($100/month)		**12.05** (0.41)	**5.91** (0.48)
Intercept	−107.59 (8.24)	41.17 (4.78)	−87.95 (7.83)
R^2	0.547	0.460	0.608
N (metro counties)	998	998	998

All slope coefficients are significant far beyond the 5% level (t between 12 and 35).

Interpretation.

- **(a) Wage only:** a county whose childcare workers earn $1,000 more a year charges, on average, **$10.15 more per week** for preschool.
- **(b) Rent only:** a county with $100 higher monthly median rent charges, on average, **$12.05 more per week**.
- **(c) Both:** holding rent fixed, $1,000 more in wages goes with **$7.09 more per week**; holding wages fixed, $100 more in rent goes with **$5.91 more per week**. Together they explain 61% of price variation.

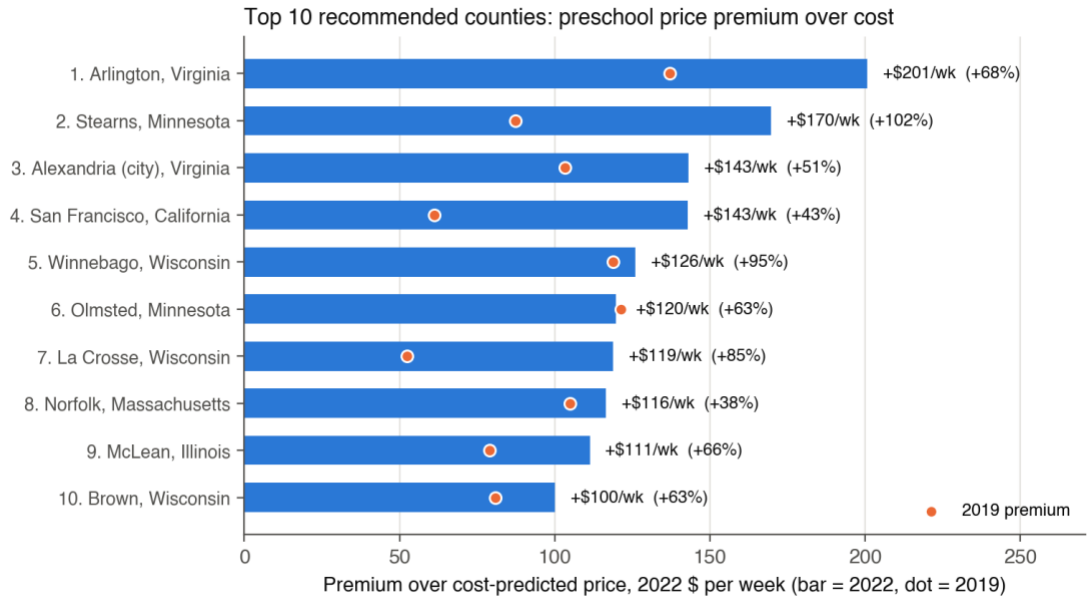

Why the coefficients fall in (c). Wages and rents are strongly correlated across counties ($r = 0.67$): high-wage metros are also high-rent metros. A one-variable regression therefore gives each cost credit for the other one too (omitted-variable bias). The bias can be computed exactly. Regressing rent on wages gives a slope of 0.518 (each $1,000 of wages comes with $51.8 more monthly rent), so the wage-only slope equals the multivariate wage effect plus the rent effect it picks up:

$$\hat{b}_{\text{wage only}} = \hat{b}_{\text{wage}} + \hat{c}_{\text{rent}} \times 0.518 = 7.09 + 5.91 \times 0.518 = 10.15.$$

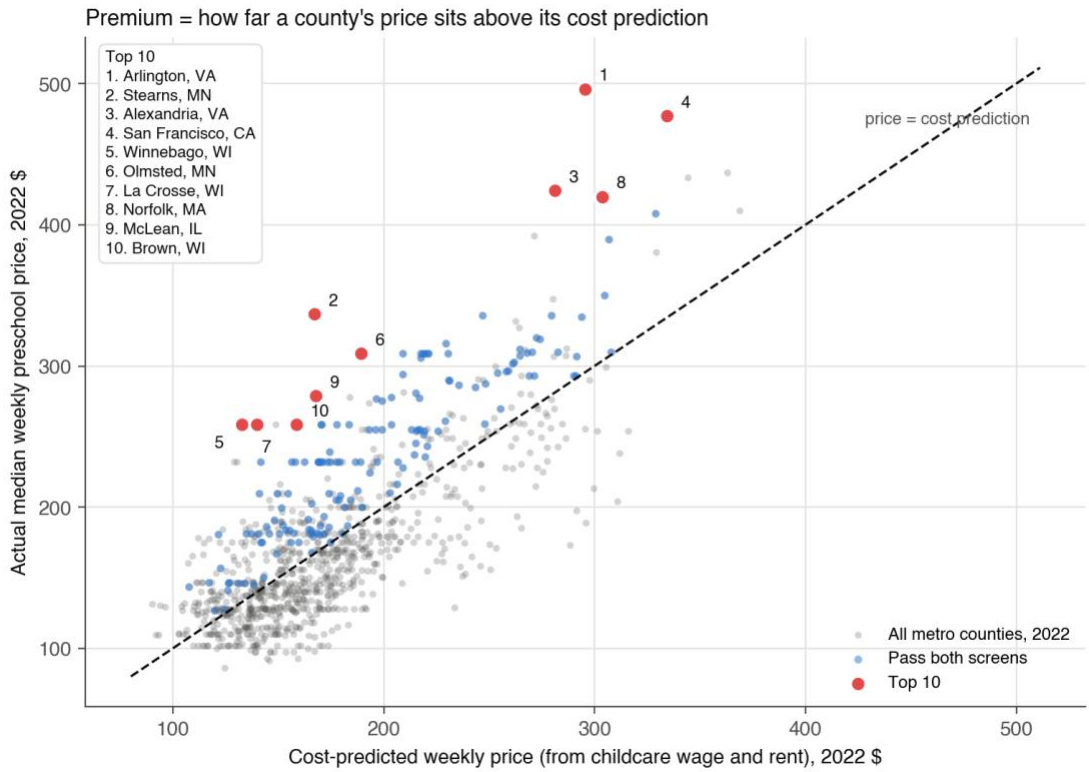

The rent coefficient falls even more (12.05 → 5.91, about half) because the rent-only regression was largely capturing the wage differences between expensive and cheap metros. Both costs still matter separately, and regression (c) is the cost model we use to judge whether a county's price is "high given its costs."

Part B. Final project analysis

(a) Recommended counties

The bars show each county's 2022 premium in dollars per week (percentage of the cost-predicted price in parentheses); dots show the same county's premium in 2019. The full list, with characteristics, is in the table in the Summary.

Every county sits on this chart at its cost-predicted price (horizontal) and actual price (vertical). The dashed line is "price = cost prediction"; the further above it a county is, the larger its premium. Blue points pass both screens; red points are the top 10.

Promising counties beyond the top 10 (ranks 11–20 among screened counties): Ramsey, Anoka, Hennepin, Carver and Dakota Counties MN (Minneapolis–St. Paul), Trumbull County OH, Howard County MD, Milwaukee and Racine Counties WI, and Burlington County NJ, all with premiums of $88–$100 a week.

(b) Methodology and reliability

Step 1: cost model. For each year 2015–2022 we estimate, across metro counties,

$$\text{price}_i = a + b \times \text{wage}_i + c \times \text{rent}_i + e_i,$$

with real 2022 dollars. The 2022 estimates are regression (c) above.

Step 2: premium. A county's premium is its residual, $e_i = \text{price}_i - \widehat{\text{price}}_i$: how much more (or less) it charges than counties with the same labor and rent costs. A positive premium means families pay more than costs alone would predict, which is the margin opportunity for a new center.

Step 3: screens. Of the 998 counties with 2022 data:

- **Market size:** at least 5,000 children under 6 with all parents in the labor force (the families who need full-time care). Below that, a market may not support a new center alongside incumbents. 461 counties pass.

- **Persistence:** a positive premium in every year it is observed from 2019 to 2022, and observed in at least 3 of those 4 years.[1] 296 counties pass.
- **Both screens:** 155 counties.

Step 4: ranking. We rank the 155 counties by their 2022 premium and recommend the top 10.

Reliability checks.

Check	Result	What it means
Model fit	R^2 between 0.56 and 0.67 in every year	Costs explain most, not all, of price differences
Coefficient stability	wage slope 6.1–8.2, rent slope 5.7–8.2 ($/week), 2015–2022	The cost model is not a one-year artifact
Out-of-time prediction	the 2019 premium predicts the 2022 premium with slope 0.88, $R^2 = 0.67$	Premiums are a persistent market feature
Functional form	a log-log model ranks counties almost identically (Spearman 0.98); 8 of our top 10 are in its top 12	Not sensitive to linear vs. percentage premiums
Residual spread	larger residuals at higher predicted prices (Breusch–Pagan $p < 0.001$)	Coefficients stay valid; very high-price counties are less predictable
Regional prices	43% of the variation in premiums is between states; 60% of counties share an exact price with another county in their state	Part of a premium can reflect a state's regional survey rate rather than the county itself

Robustness list: county-specific prices only. Several states' price surveys publish regional rates, e.g. Wisconsin reports 4 distinct prices across its 26 metro counties, Minnesota 7 across 27, Ohio 3 across 38. For a county with a regional price, the premium partly reflects lower *local* costs measured against a *regional* price. Restricting the ranking to counties whose price is shared with at most two others in the state gives:

#	County	Premium ($/wk)	In main top 10?
1	Arlington County, VA	+201	yes
2	Stearns County, MN	+170	yes
3	Alexandria city, VA	+143	yes
4	San Francisco County, CA	+143	yes
5	Norfolk County, MA	+116	yes
6	McLean County, IL	+111	yes
7	Howard County, MD	+89	new
8	Burlington County, NJ	+88	new
9	DuPage County, IL	+86	new
10	Gloucester County, NJ	+85	new

[1] Some states have no NDCP price in a given year (e.g. Virginia, California, North Carolina and Pennsylvania in 2021). Counting only observed years avoids excluding a county for missing data rather than for its premium. DC, which has prices only for 2022, is excluded by the "at least 3 of 4 years" rule, although its 2022 premium (+$121 a week) would otherwise rank it sixth.

Six of our ten picks survive every check, so we consider them high-confidence. Winnebago, La Crosse and Brown (WI) and Olmsted (MN) are promising but should be confirmed with local price data before committing capital.

(c) Market characteristics used to predict promising locations

Our selection rests on four characteristics:

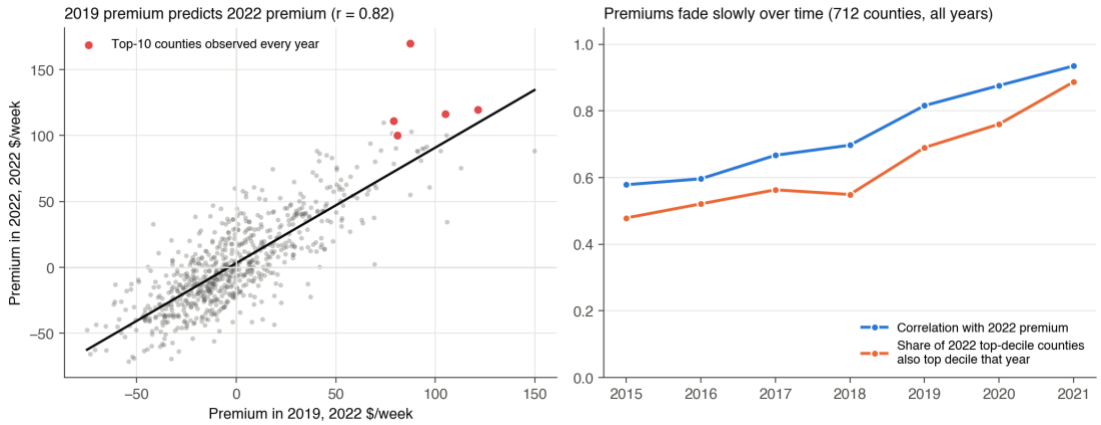

1. **Price premium over costs** (the ranking variable): price relative to what childcare wages and rent predict.
2. **Childcare-worker wages** and 3. **median gross rent**: the two main cost drivers, used to build the cost prediction.
3. **Demand depth:** the number of children under 6 whose parents all work (the market-size screen).

Together with the persistence screen, these define our recommendation. The recommended counties also share a demographic profile:

Average across counties (2022)	Top 10	All 155 screened	All 998 metro
Preschool price, $/week	352	245	174
Cost-predicted price, $/week	217	197	174
Premium, $/week	**+135**	+47	0
Childcare wage, $/yr	31,014	29,868	27,780
Median gross rent, $/month	1,437	1,241	1,106
Per-capita income, $	55,669	44,192	37,859
Women 25+ with bachelor's degree or higher	48.7%	38.7%	30.6%
Women 16–64 working full-time, year-round	51.3%	46.9%	44.6%
Children under 6 with all parents working	13,740	19,952	11,538
Share of population under 6 needing care	4.9%	4.7%	4.3%

Top-10 counties are richer, more educated and have more working mothers. Across all counties, the premium is modestly higher where income, the female college share and the share of young children needing care are higher. In a regression of the premium on these demographics, all three are significant at 5% (t = 2.1, 2.6 and 2.3), but together they explain **only 7%** of the variation in premiums. Demographics help as tie-breakers, but most of the premium reflects local market conditions (state regulation, competition, the survey's regional rates) that our data do not observe directly, which is why we rank on the measured premium rather than on demographics.

(d) Are price premiums stable over time?

Yes, mostly. We re-estimated the cost model every year and compared premiums for the 712 counties observed in all eight years:

- The correlation between a county's premium in a given year and its 2022 premium falls only gradually, from 0.94
  (2021) and 0.82 (2019) to 0.58 (2015).
- Of the counties in the top 10% of premiums in 2022, 89% were also top 10% in 2021, 69% in 2019, and 48% in 2015.
- A county's 2019 premium predicts its 2022 premium with a slope of 0.88: high-premium markets kept about 90% of their premium through the pandemic years.
- All ten recommended counties had a positive premium in every observed year from 2019 to 2022, and eight of them had a premium of more than $75 a week already in 2019 (left chart and dots in the bar chart).

Caveat. Year-to-year stability is partly mechanical. States run price surveys only every 2–3 years and the NDCP interpolates between survey years, so adjacent years share data. The comparison over three or more years (2019 or earlier vs. 2022) is the more honest test, and premiums still persist there.

(e) What our predictions are missing

1. **Competition and capacity.** We see prices, not supply. A high premium might mean unmet demand (good) or a regulated, capacity-constrained market that is hard to enter (licensing waits, staff shortages). Next step: number of licensed centers, slots per child, and waitlists by county.
2. **Regulation and staffing ratios.** States with strict staff-to-child ratios or credential rules (Minnesota is among the strictest) raise labor cost *per child* beyond the wage level we measure. Part of a Minnesota premium may be cost, not margin.
3. **Commercial real estate.** We use residential median gross rent as a proxy; center costs depend on commercial lease rates, zoning and outdoor-space requirements.
4. **Missing markets.** The NDCP has no usable 2022 prices for Pennsylvania, Indiana, Missouri, New Mexico, Arkansas and Puerto Rico (9.8% of the metro population, including Philadelphia, Pittsburgh, St. Louis, Indianapolis and Kansas City), and DC has prices only for 2022. Some of these may be attractive; we cannot rank them.
5. **Price measurement.** NDCP prices are posted median prices from state market-rate surveys, sometimes regional rates and interpolated between survey years, not realized prices after discounts or subsidies.

6. **Subsidy exposure.** In markets where many families use CCDF vouchers ($706/month in 2022, about $163 a week), effective prices are capped by reimbursement rates; this matters less in our high-income top-10 counties.
7. **Demand trends and quality mix.** Birth rates, in-migration of young families, return-to-office patterns, and whether the premium reflects higher-quality (accredited) centers that would require matching quality.
8. **Within-county location and the existing footprint** of our own centers and of competitors (e.g. Bright Horizons sites already in Arlington or San Francisco).

Appendix: data-handling decisions

- **Metro sample:** counties whose year-specific `oews_area` begins with `00`, applied as a hard rule. FIPS codes are 5-character and OEWS areas 7-character strings throughout.
- **Unit of analysis:** the county, including for the OEWS wage, which is published per metro area (every county in an area receives that area's wage).
- **Analysis dataset:** county-years with a non-missing preschool price and all predictors (998 counties in 2022). Missing values are not imputed.
- **Prices:** NDCP MCPRESCHOOL, the median weekly full-time price of center-based preschool care (36–54 months), 2024 NDCP release. NDCP `_flag` codes mark how age bands were combined, not imputation, so all prices are kept.
- **Wages:** OEWS A_MEAN for SOC 39-9011; for 2015–2017 the aggregate-MSA (aMSA_) workbook supplies the 11 largest metro areas, which the MSA file reports only by metropolitan division.
- **Inflation:** CPI-U (CUUR0000SA0) annual averages, verified against the BLS API; real $ = nominal × CPI_{2022} / CPI_year.
- **Connecticut 2022:** the 2022 ACS reports Connecticut by planning region, so its 7 metro counties have no 2022 ACS match and drop out of the 2022 analysis (1.2% of the metro population; not influential).
- **Legacy county codes** 12025 (Dade) and 51515 (Bedford city) are duplicates of current codes and dropped.
- **Ranking parameters:** market-size screen of 5,000 children under 6 with all parents working; persistence over 2019–2022 counted on observed years (at least 3 of 4); ranking on the 2022 premium in real dollars.
- **Regional prices:** flagged with the number of other metro counties in the same state reporting an identical 2022 price; a county-specific-price ranking is reported as a robustness check.
- **Unweighted:** every county counts equally in the cost model, since counties are the units we choose among.
